- Inheritance in Java

# Inheritance Basics

---

- Reusability is achieved by *Inheritance*
- Java classes can be Reused by Extending a class. Extending an existing class is nothing but reusing properties of the existing classes.
- The class whose properties are extended is known as *super or base or parent class*.
- The class which extends the properties of super class is known as *sub or derived or child class*
- A class can either **extends another class** or **can implement an interface**

# Java's Support For Inheritance

- By Extending a Class

- Syntax

```
class      class-name      extends      super-class-name
{
    .....
}
```

- Example

```
class A
{
    .....
} // End of class A
class B extends A
{
    .....
} // End of class B
```

# Java's Support For Inheritance

- By Implementing an Interface

- Syntax

```
class      class-name      implements      interface-name
{
    .....
}
```

- Example

```
interface A
{
    .....
} // End of interface A
class B implements A
{
    .....
} // End of class B
```

# Forms of Inheritance

Single Inheritance

Hierarchical Inheritance

**Multiple Class Inheritance  
NOT SUPPORTED BY JAVA**

**Multiple Interface Implementation  
SUPPORTED BY JAVA**

Multi-Level Inheritance

Multiple Inheritance

# Multiple Inheritance in Java

- Java Does Not Support Multiple Inheritance by Extending Multiple Classes
- The Following Code is Wrong

```
class A      {      } // End of class A
class B      {      } // End of class B
class C      extends A, B
{
} // End of class C
```

**Wrong Java Does not  
Allow Multiple Class  
Extensions**

# Multiple Inheritance in Java ....

- Java Supports Multiple Inheritance by Implementing Multiple Interfaces
- The Following Code is Correct

```
interface A {      } // End of interface A
interface B {      } // End of interface B
```

```
class C      implements A, B
{
} // End of class C
```

**Java Allows Multiple  
Interface  
Implementations**
